User journey: protecting order SE-1042's 14:00 promise

One complete end-to-end journey through the MVP, with the times the app records. All data is fictional.

AL **Anna Lind, DC coordinator**
DC Stockholm South office, full shift, on the phone with the floor.

EB **Erik Berg, shift lead**
Takes escalations; the only role that may approve an expedite.

SE **Order SE-1042 · B2B site delivery, plasterboard**
Pick 09:30 · route 10:00 · last viable 11:30 · promised 14:00 (Round 1 example).

Stage	09:30 Detect	09:30 Take ownership	09:31 Escalate	09:32 Decide	09:52 - 12:32 Follow through	15:27 Measure
Course pick · cutoff · last viable · promise						On time, 12:32
User does	**SE-1042 tops the queue:** pick not confirmed, 30 min before the 10:00 route. It ties with SE-1051; B2B goes first.	**Anna takes ownership** and reads the course: cutoff 10:00, last viable 11:30, promise 14:00.	**Floor says: not picked,** picker on break. An expedite is not her call, so she escalates with the reason.	**Erik expedites:** moves a picker and records it with evidence and a EUR 10 cost.	**Nobody chases the order;** Anna works the next case.	**Shift lead and operations manager** review the day on Outcomes.
PromiseOps does	**Raises one exception:** the pick milestone passed and the feed was read after 09:30, so the gap is real. Owner Anna, 15-min timer.	**Stops the escalation timer;** logs the owner and the response time.	**Locks the expedite** for a coordinator; moves the case to the shift lead with Anna's note.	**Requires evidence and cost;** closes the case; logs who decided and why.	**Matches the feed to the course:** pick 09:52 and dispatch 10:17 (late, brown, before the 11:30 limit), delivery 12:32.	**Measures against the original promise:** 93.3% on time, 1 late delivery prevented, EUR 25 (Round 1 assumption) vs EUR 10 logged.
Value	**The next order to save is first;** no spreadsheet scanning.	**One accountable owner,** visible to the whole shift.	**Decision rights are explicit,** not tribal.	**Fast decision,** audit trail, cost data for Finance.	**The system watches;** people act only when needed.	**Measured honestly,** ready for the pilot comparison.
How it feels	Alerted	Owns it	Needs a decision	Decided	Calm	Proven

Same morning, nobody acts

The missing pick is found after the route leaves: picked 11:20, dispatched 11:55, delivered **14:25: late**.

86.7% on time

Outcomes at 15:30.

With PromiseOps

Owned at 09:30, shift lead decision 09:32, delivered **12:32: on time**. The promise was never moved.

93.3% on time

1 late delivery prevented.

Other paths in the same demo

- **False alarm** (SE-1051): scanner synced late; closed with evidence to tune the rules.
- **No vehicle** (SE-1077): handed to customer service with a new ETA; still counted late.
- **No response**: after 15 min the case moves to the shift lead.
- **Feed outage**: 30 min without data pauses alerts and opens a data task.

Course row: missed · escalated · ahead · confirmed late · confirmed

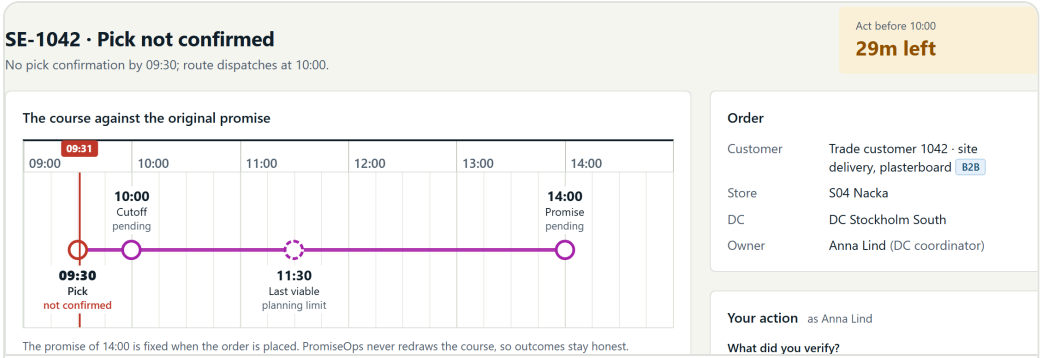

Interface in English and Vietnamese · every time above is from the activity log

Storyboard: the same journey on real MVP screens

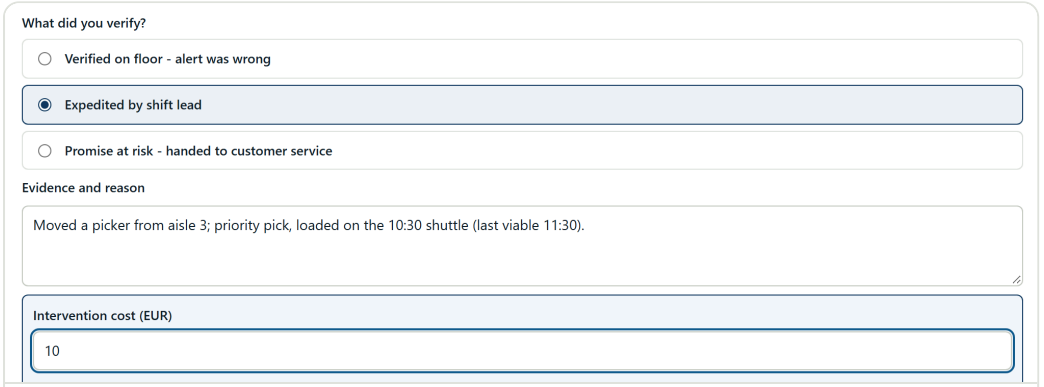

Captured from the running application (local, demo harness on). Times are the simulated DC clock; each recorded action takes one minute.

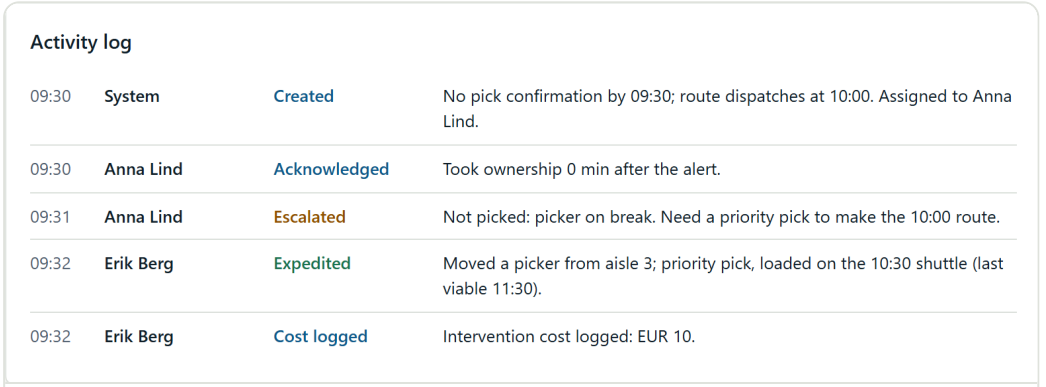

1 09:30 Detect SE-1042 (B2B) and SE-1051 missed the 09:30 pick; ties go to B2B.

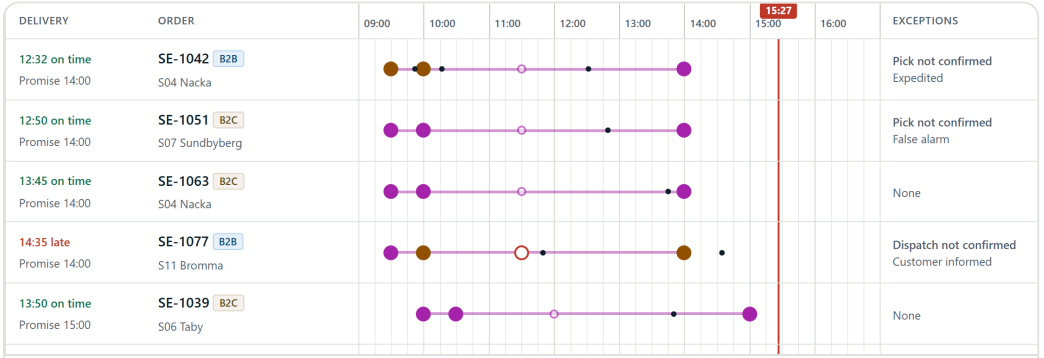

2 09:30 Take ownership The course at full size: pick missed, cutoff 10:00, promise 14:00.

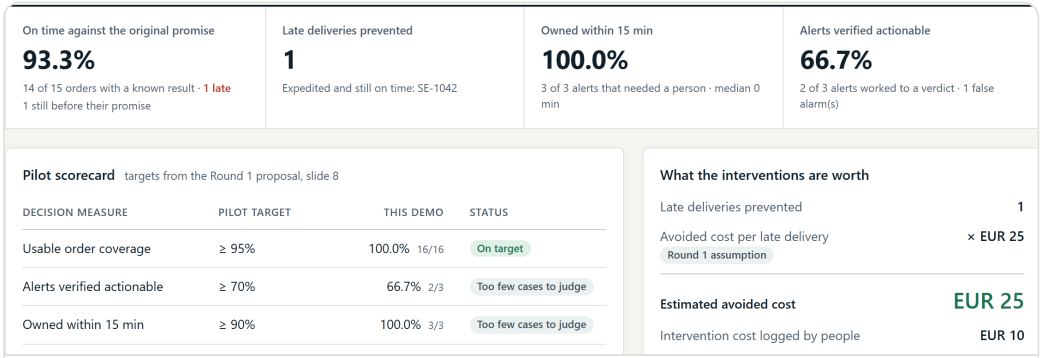

3 09:32 Decide As shift lead: expedite allowed, with evidence and a EUR 10 cost.

4 09:32 Recorded Who took it, who escalated, who decided, why, and the cost.

5 12:32 Follow through SE-1042 delivered 12:32, before 14:00; brown = confirmed late.

6 15:27 Measure 93.3% on time, 1 late delivery prevented, Round 1 scorecard and value.

Try it: run.ps1, open http://127.0.0.1:8000/app, follow the demo script in the README.
