User journey: protecting order SE-1042's 14:00 promise

One complete end-to-end journey through the MVP, with the times the app records. All data is fictional.

AL **Anna Lind, DC coordinator**
DC Stockholm South office, full shift, on the phone with the floor.

EB **Erik Berg, shift lead**
Takes escalations; the only role that may approve an expedite.

SE **Order SE-1042 · B2B site delivery, plasterboard**
Pick 09:30 · route 10:00 · last viable 11:30 · promised 14:00 (Round 1 example).

Stage	09:30 Detect	09:30 Take ownership	09:31 Escalate	09:32 Decide	09:52 - 12:32 Follow through	15:27 Measure
Course						
User does	SE-1042 tops the queue: pick not confirmed, 30 min before the 10:00 route. It ties with SE-1051; B2B goes first.	Anna opens the order and takes ownership; the course shows cutoff, last viable dispatch and promise.	Floor says: not picked, picker on break. An expedite is not her call, so she escalates with the reason.	Erik, the shift lead, moves a picker and records Expedited with evidence and a EUR 10 cost.	Nobody chases the order; Anna works the next case.	Shift lead and operations manager review the day on Outcomes.
PromiseOps does	Pick milestone passed, and the warehouse feed was read after 09:30, so the gap is real. One exception, owner Anna, 15-min timer.	Stops the escalation timer; logs the owner and the response time.	Expedite is locked for a coordinator; the case moves to the shift lead with Anna's note.	Requires evidence and the intervention cost; closes the case; logs who decided and why.	Pick 09:52 and dispatch 10:17 arrive (late, brown, but before the 11:30 limit). Delivery 12:32 is matched to the promise.	On time vs the original promise: 93.3%. 1 late delivery prevented, EUR 25 at the Round 1 assumption vs EUR 10 logged; Round 1 scorecard.
Value	The next order to save is first; no spreadsheet scanning.	One accountable owner, visible to the whole shift.	Decision rights are explicit, not tribal.	Fast decision, audit trail, cost data for Finance.	The system watches; people act only when needed.	Measured honestly, ready for the pilot comparison.
How it feels	**Alerted**	**Owns it**	**Needs a decision**	**Decided**	**Calm**	**Proven**

Same morning, nobody acts

The missing pick is found after the route leaves: picked 11:20, dispatched 11:55, delivered **14:25: late**.

86.7% on time

Outcomes at 15:30, against the original promise.

With PromiseOps

Owned at 09:30, shift lead decision 09:32, delivered **12:32: on time**. The promise was never moved.

93.3% on time

1 late delivery prevented; both runs replay in the demo.

Other paths in the same demo

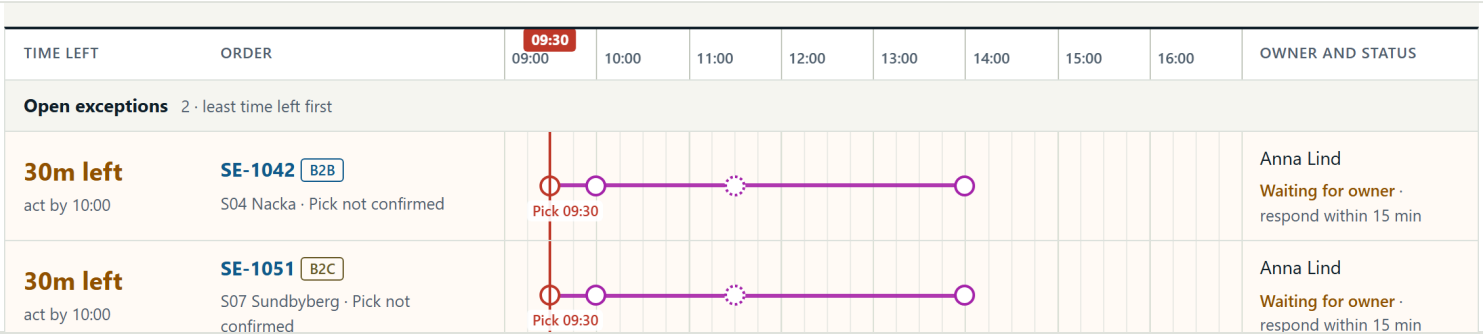

- **False alarm** (SE-1051): scanner synced late; closed with evidence to tune the rules.
- **No vehicle** (SE-1077): handed to customer service with a new ETA; still counted late.
- **No response**: after 15 min the case moves to the shift lead.
- **Feed outage**: 30 min without data pauses alerts and opens a data task.

Course row: ○ missed ◎ escalated ● confirmed late ● confirmed

Interface in English and Vietnamese · every time above is from the activity log

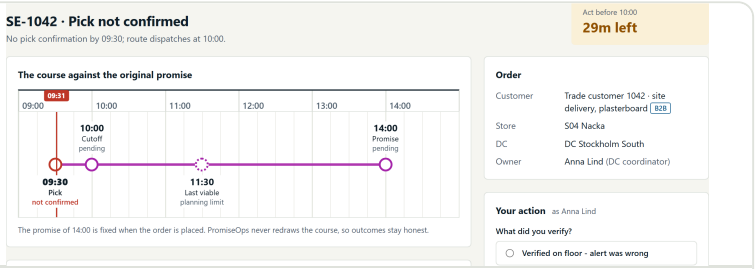

Storyboard: the same journey on real MVP screens

Captured from the running application (local, demo harness on). Times are the simulated DC clock; each recorded action takes one minute.

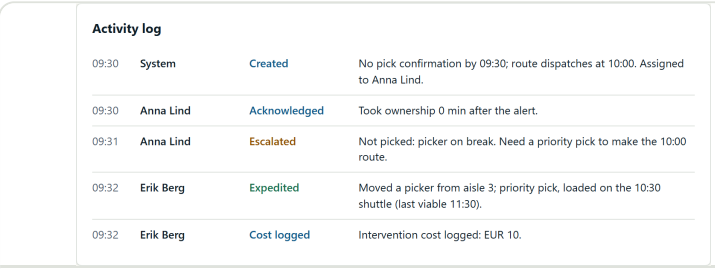

1 09:30 Detect

SE-1042 (B2B) and SE-1051 missed the 09:30 pick: red ring at Pick, 30 min to act. Ties go to B2B.

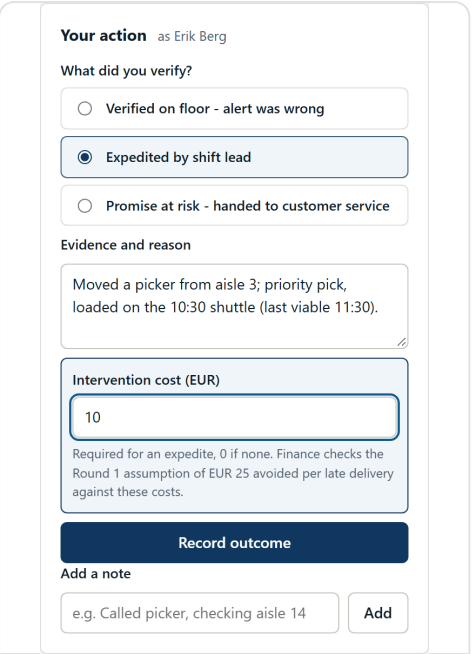

2 09:30 Take ownership

The course at full size: pick missed, cutoff 10:00, last viable 11:30, promise 14:00.

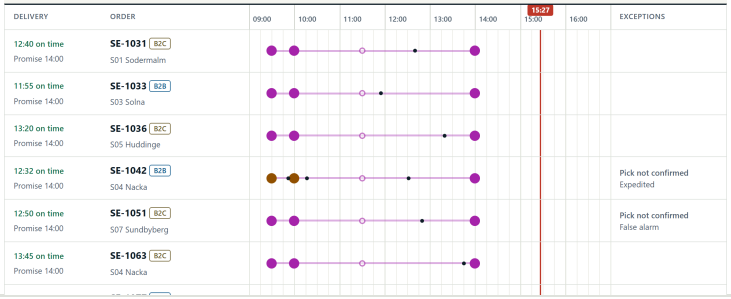

4 09:32 Recorded

Activity log: who took it, who escalated, who decided, why, and the cost.

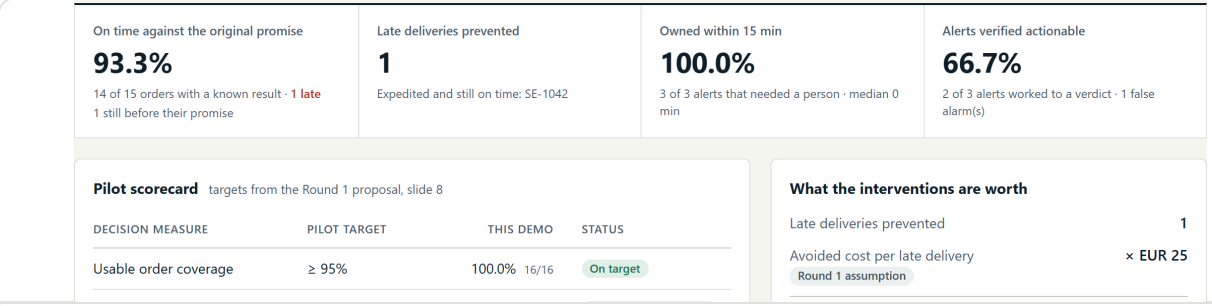

3 09:32 Decide

Signed in as shift lead: Expedited is allowed, with evidence and the intervention cost for Finance.

5 12:32 Follow through

SE-1042 delivered 12:32, before 14:00; brown = confirmed late, black dot = actual time.

6 15:27 Measure

On time against the original promise, late deliveries prevented, response time, Round 1 scorecard and value.

Try it: run.ps1, open http://127.0.0.1:8000/app, follow the demo script in the README.
